

AI OPs Assignment 1 - Report Summary

Madhav Arun Krishna - DA24B012

August 2026

1 Question 1

I solved this question by referring the slides on the 6 hidden technical debts. The answers can be found in the pdf in the q1 folder of this repo.

2 Question 2

I solved this question by referring the example notebooks shared and have attached by screenshots, analyses and extra code in the pdf in the q2 folder of this repo

3 Question 3

DVC Remote;

- Since we were explicitly asked to use a DVC remote (and local was not allowed), I tried looking for online buckets.
- The AWS registration process was not very simple, and I found this other online service called **BackBlaze** which provides small private buckets for free and allowed me to easily connect to it and use it as my DVC remote.

Unzipping and Creation of CSVs:

- Since we were asked to track the CSV using DVC, I unzipped and created a csv using the filenames, and ensured there were 1801 lines including the header.
- I tracked the CSV using DVC, committed data.csv.dvc, tagged this version as v1, and pushed the DVC data to Backblaze. I then unzipped new-labels.zip, regenerated the CSV, and verified that it contained 2801 lines. This became v2.
- Finally, I ran `git checkout v1` followed by `dvc checkout`. I then confirmed that the rollback restored exactly 1801 lines.

4 Question 4

- My partner was Krish Dange (DA24B011). I was partner A and he was partner B.
- We chose to use the Iris dataset with the RandomForest Classifier like before.
- I created the model, environment.yml file, requirement.txt file, the training script, and all necessary files and pushed it into my repo.
- My partner was able to pull the repo and reproduce the same metrics that I had in my run.
